

Package: ggpirate (via r-universe)

October 25, 2024

Type Package

Title Pirate plotting for ggplot2

Version 0.1.2

Description Extends ggplot2 to make it easy to create pirate plots.

Depends R (>= 4.0), ggplot2 (>= 3.3.2)

License GPL-3

URL <https://github.com/mikabr/ggpirate>

BugReports <http://github.com/mikabr/ggpirate/issues>

Encoding UTF-8

LazyData true

Imports dplyr (>= 1.0.1), purrr (>= 0.3.4)

RoxygenNote 7.1.1

Repository <https://mikabr.r-universe.dev>

RemoteUrl <https://github.com/mikabr/ggpirate>

RemoteRef HEAD

RemoteSha 83528923ff2c7559dd585e5f883dcc8731af169b

Pirate plots

Description

A pirate plot (<https://cran.r-project.org/web/packages/yarr/vignettes/pirateplot.html>) is a way of displaying data where a continuous dependent variable is a function of a categorical independent variable, in a more informative way than the traditional barplot. `geom_pirate` plots the raw data as points (using `geom_jitter`), along with layers showing descriptive and inferential statistics – bars indicating means (using `geom_col`), horizontal line indicating means (using `geom_crossbar`), boxes indicating 95% confidence intervals assuming a normal sampling distribution (using `geom_tile`), and violins indicating the density (using `geom_violin`).

Usage

```
geom_pirate(
  mapping = NULL,
  data = NULL,
  ...,
  points = TRUE,
  bars = TRUE,
  lines = TRUE,
  cis = TRUE,
  violins = TRUE,
  points_params = list(shape = 1, size = 1),
  bars_params = list(alpha = 0.3, width = 0.9),
  lines_params = list(size = 0.5, width = 0.9),
  cis_params = list(fill = "white", size = 0.5, alpha = 0.5, width = 0.8),
  violins_params = list(fill = "white", size = 0.5, alpha = 0, width = 0.7),
  jitter_width = 0.2,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```

Arguments

<code>mapping</code>	Set of aesthetic mappings created by <code>aes()</code> or <code>aes_()</code> . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
<code>data</code>	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

<code>...</code>	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
<code>points</code>	logical indicating whether to show points
<code>bars</code>	logical indicating whether to show mean bars
<code>lines</code>	logical indicating whether to show mean lines
<code>cis</code>	logical indicating whether to show 95% confidence intervals boxes
<code>violins</code>	logical indicating whether to show violins
<code>points_params</code>	list of parameters to pass to points layer
<code>bars_params</code>	list of parameters to pass to bars layer
<code>lines_params</code>	list of parameters to pass to lines layer
<code>cis_params</code>	list of parameters to pass to CIs layer
<code>violins_params</code>	list of parameters to pass to violins layer
<code>jitter_width</code>	amount of horizontal jitter added to the locations of the points (defaults to 20% of the resolution of the data)
<code>na.rm</code>	If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
<code>show.legend</code>	logical indicating whether this layer be included in the legends (defaults to FALSE)
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders()</code> .

Examples

```
ggplot(mpg, aes(x = class, y = cty)) +  
  geom_pirate(aes(colour = class))
```
